

NEW PRODUCT

Wing Union Pressure Transducer

Norwegian company Scan-Sense recently launched a new development of its popular 1502/2202 Wing Union Pressure Transducer, widely used in drilling and process operations, with a unique feature. Standard Wing Union Transducers measure pressure only, giving a 4-20mA signal output, the latest model from Scan Sense offers both Pressure and Temperature from the same product.

For new installations, it removes the need for an extra connection elsewhere for a Temperature sensor, reducing both sensor costs and installation costs. For replacement of existing Wing Union Transducers in older systems it gives the ability to take a temperature measurement with no additional installation work.

There are two 4-20mA signal outputs, one each for pressure and temperature. Scan Sense's unique design also has a special 'anti-shock' diaphragm, minimising the risk of damage and introducing a zero-offset to the sensor element when they are hammered into place. Scan Sense offers their product on a short-delivery time, and to cover a wide pressure and temperature range, direct from the manufacturer in either Norway or the UK.
